

Our Purpose

To provide education and foster opportunities for both current and future generations.

Our Values

Commitment

Committed in serving: Our customers and communities

Accountability

Taking Accountability in everything we do

Initiative

Do more and the right thing without being told

Compassion

Show sympathy and concern of others

Ownership

Lubanzi Automation Academy (LAA) is a subsidiary of Lubanzi ICT Consulting to focus on ICT Training and Skills Development.

LAA has partnered MICTSETA to drive the 4IR skills development Initiatives.

LAA is equipped and backed up by Lubanzi ICT Consulting to offer most needed skills in the market and training the youth on other skills that can be beneficial to the careers.

What is RPA?

Robotic Process Automation is the technology that allows anyone today to configure computer software, or a “robot” to emulate and integrate the actions of a human interacting within digital systems to execute a business process.

RPA Qualification

The purpose of this qualification is to prepare a learner to operate as a Robotic Process Automation (RPA) Developer. The Robotic Process Automation (RPA) Developer works with other developers and solution architects to develop robotic processing automation software to emulate the business process defined by the process owner and documented by the business analysts. They configure software RPA solutions to perform automated business processes that typically interact with multiple applications and data.

A qualified learner will be able to:

- Develop RPA solutions which emulate human actions during the project development stage using platform knowledge and data analysis capabilities.
- Execute test procedures for evaluating the performance of the RPA solution through test cases and decide whether it passes or fails.
- Modify and improve existing RPA solutions and build reusable components (post-production).

Outcomes of the Program

Become Junior RPA Developers

Understand concepts of Robotic Process Automation.

Develop familiarity and deep understanding of RPA tools.

Develop the ability to independently design and create robots for business processes

RPA Certificate

What is Test Automation?

Test automation refers to the use of software tools and scripts to perform automated testing of software applications.

It involves creating scripts or test cases that can automatically execute predefined actions, validate expected outcomes, and compare them with the actual results.

Test automation is widely used in software development and quality assurance processes to improve efficiency, increase test coverage, and ensure the reliability of software products.

Quality Test Automator Qualification

The purpose of this qualification is to prepare a learner to function as a Quality Test Automator.

A Quality Test Automator is responsible for the quality of software development and deployment. Qualifying learners are involved in performing automated and manual tests to ensure the software created by developers is fit for purpose and any bugs or issues are identified within a product and reported to the relevant person before it gets deployed to everyday users. Some of the duties include analysis of software, mitigation of risk, prevention of software issues and testing of any changes.

A qualified learner will be able to:

- Review and analyse software requirements, prepare test scenarios, and write test cases.
- Set up and configure test data and a test environment.
- Execute manual or automated test scripts and on software usability and review results in terms of database impact, defects, errors or bugs and usability.

Outcomes of the Program

1. Extract information from test-based documentation and execute a systematic analysis of the requirements to determine what must be tested and how and when it must be tested.
2. Set up and configure a test environment that provides accurate feedback about the quality and behaviour of the application under test.
3. Execute manual or automated test scripts as well as on software usability and review results in terms of database impact, errors or bugs and usability against expected results.

What Software Development?

Software development is the process of creating, designing, coding, testing, and maintaining software applications or systems.

It involves a structured approach to building software products to meet specific requirements, solve problems, or fulfil the needs of users or organizations.

Software development encompasses various activities and stages, including planning, analysis, design, implementation, testing, deployment, and maintenance.

Software Development Qualification

Purpose:

The purpose of this qualification is to prepare a learner to operate as a Software Developer.

A Software Developer analyses a set of requirements, translates these into a working software solution using a programming language. They test, implement and maintain software applications to meet client specifications as well as functional and technical requirements.

A qualified learner will be able to:

- Interrogate the specification and problem and interpret it into code and articulate in writing.
- Build a logical flow using the framework and methodologies at their disposal to propose possible solutions to business challenges.
- Programme effectively using a suitable programming language to develop and test new solutions and update existing solutions.

Outcomes of the Program – Software Dev

Interrogate the specification and problem and interpret it into code and articulate in writing.

Build a logical flow using industry standard frameworks and methodologies to propose possible solutions to business challenges to meet both functional and technical requirements.

Programme effectively using a suitable programming language to develop new solutions and update existing solutions.

Test and maintain software and recommend improvements to ensure strong functionality and optimisation to meet both functional and technical requirements.

Function effectively, efficiently, and ethically in the workplace to achieve company and team goals and targets.

What Artificial Intelligence AI?

AI, or Artificial Intelligence, refers to the simulation of human intelligence in machines that are programmed to think, learn, and problem-solve like humans. The goal of AI is to create systems that can perform tasks that would typically require human intelligence, such as understanding natural language, recognizing patterns, making decisions, and learning from experience.

Artificial Intelligence Qualification

Purpose:

The purpose of the Occupational Certificate: Artificial Intelligence Software Developer is to prepare a learner to operate as an Artificial Intelligence Software Developer

Artificial Intelligence Software Developers build Artificial Intelligence (AI) functionality into software applications through integrating and implementing AI algorithms and logic into the deliverables of an Information Technology (IT) project. Developers teach the machine to solve problems the way a human would through the use of programming. They create, test and deploy code. These developers also assist in converting machine learning Application Programming Interface (APIs) so that other applications can use them.

A qualified learner will be able to:

Interpret solution design documentation and develop AI solution.

Train the AI model through a machine learning process and test the performance to ensure that model accuracy is strictly maintained within the selection framework.

Deploy the AI solution and maintain the solution to ensure model accuracy is strictly maintained.

Outcomes of the Program – AI

1. Gather and interpret data from various sources to define an AI solution to a real-life world problem.
2. Critically analyse data and create a solution design document (SDD) that defines an artificial intelligence (AI) solution that solves a real-life world problem.
3. Choose a type or category of AI learning and the relevant algorithm to analyse data, gain insight and make subsequent prediction, or create a determination with it.
4. Train the AI model through a machine learning process and ensure that model accuracy is strictly maintained within the selection framework.
5. Select a machine learning system and build an artificial intelligence (AI) solution to a real-life world problem.
6. Implement and run the AI solution on a selected platform and check the prediction results in real-life use, then select and run the AI solution on a platform.

OUR EXPERIENCE

MICT SETA 4IR Skills Development Training

The Academy is currently running 2 Internship groups & Concluded 1 from MICTSETA (2024-2026)

- Group 1 (Concluded)
Duration: 1 August 2023 - 31 July 2024
Number of Interns: 25
- Group 2 (Current)
Duration: 1 October 2024 - 30 September 2025
Number of Interns: 20
- Group 3 (Current)
Duration: 1 April 2025 - 31 March 2026
Number of Interns: 15

Cell: 067 061 1355
